- Terminating Side

A Complete Call Waiting Sequence Between Three Parties

Related Information

Introduction

This document contains **debug mgcp packets** captures of various Media Gateway Control Protocol (MGCP) call sequences. Each sequence is displayed chronologically in a table. The tables contain message (**MSG**) and **DECODE** fields. The **MSG** fields contain the actual **debug** output, and the **DECODE** fields explain the preceding **debug** message. Currently, there are **debug** sequences showing:

- A handset goes off–hook and user dials digits
- A handset receives a busy tone
- A complete on–net voice call that shows originating and terminating sides
- A complete call waiting sequence between three parties

This document is Part 5 of a six–document set.

1. Configuring Cisco CallManager 3.x with IOS MGCP Gateways (Analog FXO, FXS Ports)
2. Configuring the Cisco IOS MGCP Gateway
3. Configure MGCP Gateway and FXO/FXS Ports on a Cisco CallManager Server
4. Verify and Troubleshoot the Cisco IOS MGCP Gateway
5. Sample of Debug MGCP Packets
6. Monitor, Reset, and Delete MGCP Gateways for Cisco CallManager

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

This configuration was tested with Cisco CallManager 3.0, 3.1, and 3.2 and various versions of Cisco IOS® Software Release 12.2 images. The screen shots and Cisco IOS configuration were captured using the software, hardware, and other equipment listed below.

- 1 * Cisco VG200 / 2 X FXS / 2 X FXO / 1 FastEthernet 10/100 port; Cisco IOS Software Release 12.1(5)T
- 1 * Cisco CallManager 3.0(5a) running on an MCS7835
- 2 * Analog handsets
- 2 * Cisco 7960 IP Phones

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

For recommended compatibility software versions between Cisco CallManager and the Cisco IOS gateway, refer to the Cisco CallManager Software Version Comparison.

Note: Cisco IOS Software Release 12.2(11)T or later is recommended based on the **ccm-manager** command enhancements. The **ccm-manager** command requires Cisco IOS Software Release 12.1(5)XM or later on all routers (Cisco 2600 and 3600) and the Cisco Voice Gateway 200 (VG200).

Cisco 2600 and 3600 routers support MGCP if they are running Cisco IOS Software Release 12.1(3)T or later. The release and version that you require are based on the features that you need to enable. The Cisco CallManager server must be running version 3.0(5)a or later. The router configuration is the same for all types of routers. The Cisco CallManager configuration is also the same for all types of routers.

The VG200 is supported by Cisco IOS Software Release 12.1(5)XM1 and later releases. The release and version that you require are based on the features that you need to enable. Although the VG200 is supported in earlier releases of Cisco CallManager, version 3.0(5)a or later is recommended.

Conventions

For more information on document conventions, refer to the Cisco Technical Tips Conventions.

Debug Sequence for When a Handset Goes Off-Hook and User Dials Digits

The **MSG** fields in the table shown below are captures of the **debug mgcp packets** command output when a telephone goes *off-hook* and the user dials digits. The **DECODE** fields provide an interpretation of the MGCP messages produced by the **debug** command.

MSG	<pre>21:50:26: send_mgcp_msg, MGCP Packet sent ---> NTFY 41 aaln/S1/SU0/1@c26001.at10.cisco.com MGCP 0.1 N: mgcp.aSCT1CA.at10.cisco.com:2427 X: 50 O: L/hd</pre>

A Complete On-Net Voice Call That Shows Originating and Terminating Sides

The **MSG** fields in the two tables shown below are captures of the **debug mgcp packets** command output when a complete telephone call is made and torn down. The first table shows a call from the perspective of the originating side, while the second table depicts the perspective of the terminating side. The **DECODE** fields

provide an interpretation of the MGCP messages produced by the **debug** command.

Originating Side

A Complete Call Waiting Sequence Between Three Parties

The **MSG** fields in the two tables shown below are captures of the **debug mgcp packets** command output when call waiting is signaled to one gateway endpoint by a call agent. The first table shows endpoint `aaln/S1/SU0/0@opt0-2611-1.ss.cisco.com` make a phone call to 472-0002, which terminates on the same residential gateway, and receive a call waiting indication during the call. The second table shows endpoint `aaln/S1/SU0/1@opt0-2611-2.ss.cisco.com`, located on another residential gateway, placing the call that initiates the call waiting indication to `aaln/S1/SU0/0@opt0-2611-1.ss.cisco.com`. The **DECODE** fields provide an interpretation of the MGCP messages produced by the **debug** command.
